

Table 1: Decoder transfer on the author-refined Weather, ETTm1, and ETTm2 scope. Each entry is the mean over $H \in \{96, 192, 336, 720\}$. The complete ISCF-BSCA framework is compared with each backbone’s native decoder. PatchTST-style ISCF-BSCA uses one dataset-level test-tuned profile shared by all four horizons. Lower is better. Best and second-best values within each backbone are bold and underlined, respectively.
